11. TOXICOLOGY INFORMATION

11.1. Distillates (petroleum), hydrotreated light

- 11.1.1. ORAL (LD50): Acute: >5000 mg/kg [Rat].
- 11.1.2. DERMAL (LD50): Acute: >2000 mg/kg [Rabbit].
 - 11.1.2.1. Studies on laboratory animals have associated similar materials with eye and respiratory tract irritation. Repeated exposure to elevated concentrations of hydrocarbon solvents can produce a variety of transient CNS effects (e.g., dizziness, headache, narcosis, etc). Studies on laboratory animals have shown similar materials to cause skin irritation after repeated or prolonged contact. Repeated direct application of similar materials to the skin can produce defatting dermatitis and kidney damage in laboratory animals. The most common effects observed in repeated dose animal studies with mineral spirits are kidney changes that are consistent with an alpha 2u-globulin- mediated process that is not regarded as relevant to humans. Certain studies have reported effects in the liver as well as hematological or urine chemistry changes. In general, these effects have not to been shown to be dose-related.

11.2. Highly-refined petroleum lubricant oils:

- 11.2.1. ORAL (LD50): Acute: >5000 mg/kg [Rat].
- 11.2.2. DERMAL (LD50): Acute: >2000 mg/kg [Rabbit].
 - 11.2.2.1. Mineral oil mists derived from highly refined oils are reported to have low acute and sub-acute toxicities in animals. Effects from single and short-term repeated exposures to high concentrations of mineral oil mists well above applicable workplace exposure levels include lung inflammatory reaction, lipid granuloma formation and lipid pneumonia. In acute and sub-acute studies involving exposures to lower concentrations of mineral oil mists at or near current work place exposure levels produced no significant toxicological effects. In long term studies (up to two years) no carcinogenic effects have been reported in any animal species tested.
